

ULTRA4 proposes a better option in all cases: The Web Applications Development Platform

- 1) UltraCore provides you with a **standardized source code architecture (*)** and an **extensive core software infrastructure (**)** that is inevitable in any modern business application.
- 2) With UltraCore **any developer can become productive in developing web apps within a few days (***)**. In this way you **keep your developers** and **utilize their valuable experience in the business domain**.
- 3) You combine UltraCore with a limited external consultancy at your premises (1-2 consultants) that aims to **educate "on-the-job"** your development team in using UltraCore within a particular project.
- 4) The consultancy ends up with the **transfer of the complete know-how on the source code of UltraCore to the team**. Also the **methodology on how to autonomously extend the source code of the development platform is transferred to the team**.
- 5) After the consultancy, **you will never walk alone**: With an inexpensive maintenance contract, ULTRA4 will provide you with all the new Releases of UltraCore and immediate advice to any question your developers might have via Webinars, Remote Desktop and world-wide call-back service for free.

(*) proven to be optimal for web business applications in a multitude of real-world projects and being steadily extended by incorporating generic features according to the needs of every new project.

(**) Out-of-the-box Logging, Auditing, LDAP Connectivity, Asynchronous Batch Job Processing, User Management, Reporting, Alarming, Notifications, and much more.

(***) The only prerequisites are basic knowledge of the Java Programming Language and Relational Databases.
